

MedVisionAI AI Interpretation Guidelines

Overview

AI is a clinical decision-support tool designed to assist—not replace—qualified healthcare professionals.

Workflow

Image Quality Check → AI Detection → Confidence Review → Visual Verification → Clinical Correlation → Radiologist Review → Final Report.

Best Practices

Review confidence scores, inspect highlighted regions, compare with symptoms, avoid relying on AI alone, document uncertainty.

Limitations

Performance depends on image quality, training data, disease prevalence, and cannot independently diagnose patients.

Ethical Considerations

Maintain patient privacy, fairness, transparency, human oversight, and regulatory compliance.
